

Buzza MCP ChatGPT Integration

Overview

Buzza is an AI-powered business analytics platform built on the **Model Context Protocol (MCP)** that enables merchants to interact with their business data using natural language.

Instead of navigating traditional dashboards, merchants can ask questions like:

- How did my business perform yesterday?
- Which products are generating the highest revenue?
- Who are my most valuable customers?
- When do customers visit most frequently?
- What are the sales trends this month?

Buzza securely retrieves analytics from MarketBuzz and Clover, performs backend aggregations, and returns conversational responses together with interactive charts inside ChatGPT.

Although initially built for the **ChatGPT App Marketplace**, the MCP server is platform-agnostic and can be integrated with any MCP-compatible AI client or marketplace.

Problem

Business owners often spend significant time navigating dashboards, filtering reports, and interpreting analytics.

Traditional BI tools require users to know:

- where the data lives
- which report to open
- how to configure filters
- how to interpret charts

Buzza removes this friction by allowing merchants to simply ask questions in natural language.

Solution

Designed and built an MCP server that exposes business analytics as AI tools.

The MCP server connects conversational AI with MarketBuzz's analytics platform and returns structured business insights in real time.

The solution includes:

- MCP Server
- Analytics Tool Registry
- Fastify APIs
- ClickHouse analytics
- MongoDB metadata
- Clover integration
- OAuth account linking
- ChatGPT App frontend
- Interactive charts

Key Features

Conversational Analytics

Ask business questions naturally.

Examples

"How much did I earn yesterday?"

"Show my best selling products."

"Compare this week with last week."

"Which customers visit most frequently?"

AI Tool Calling

Implemented MCP tools for analytics including:

- Customer Insights
- Customer Summary
- Customer Visit Trends
- Sales Insights
- Sales Summary
- Sales Trends
- Sales Heatmaps

- Product Insights
- New Customers
- Repeat Customers
- Total Sales
- Total Customers
- Funnel Journey
- Visit Frequency
- Merchant Linking

Interactive Visualizations

Instead of returning plain text, Buzza can generate:

- Sales trend charts
- Revenue comparisons
- Heatmaps
- Product rankings
- Customer insights
- Funnel visualizations

Secure Merchant Linking

Implemented OAuth account linking between:

- ChatGPT user
- Clover Merchant
- MarketBuzz

This ensures every AI request is securely mapped to the correct merchant before analytics are retrieved.

Real-time Analytics

Analytics are generated using:

- ClickHouse
- MongoDB
- Backend aggregation APIs

instead of relying on LLM memory.

Architecture

Technical Highlights

AI

- Model Context Protocol (MCP)
- Tool Calling
- ChatGPT Apps SDK
- Structured Outputs
- Prompt Engineering
- Conversational Analytics

Backend

- Node.js
- Fastify
- REST APIs
- Swagger / OpenAPI
- OAuth
- JWT

Databases

- ClickHouse
- MongoDB

Frontend

- React
- Charts

- OpenAI Apps SDK
- Interactive Widgets

Integration

- Clover APIs
- OAuth
- ChatGPT Marketplace
- MCP

Challenges Solved

1. AI Tool Orchestration

Mapped natural language questions into the correct analytics tool without exposing backend complexity.

2. Secure Identity Mapping

Linked:

ensuring users only access their own business analytics.

3. High Performance Analytics

Used ClickHouse aggregations to return business insights within conversational response times.

4. Structured Responses

Designed tools that return structured JSON instead of raw database results, allowing ChatGPT to generate accurate, context-aware responses.
